

AI Engineer - Agentic Systems

Mumbai / Remote India Rs.12-20 LPA + Equity 3+ yrs experience

SUMMARY

Build autonomous AI agents that execute multi-step workflows and run entire business functions in production.

ABOUT THE ROLE

Join a stealth-mode startup building the future of autonomous AI operations. You'll tackle the hardest problem in AI engineering: making agents that work reliably in production. We're not building chatbots or copilots - we're building autonomous operators that execute complex workflows, make decisions, and handle edge cases without human intervention. This is ground-up engineering with direct model APIs and custom orchestration, where your work will define how AI agents actually function in real business environments.

WHAT YOU'LL NEED

- 3-6 years of software engineering experience
- Built production systems with LLMs (not just prototypes)
- Experience with agent patterns including tool use, planning, and state management
- Strong programming in Go OR TypeScript
- System design skills with ability to architect for reliability
- Production mindset focused on errors, edge cases, and observability

NICE TO HAVE

- Built agent frameworks or orchestration systems from scratch
- Experience with workflow engines or state machines
- Background in distributed systems
- Contributions to AI/agent open-source projects

THE STACK

Go · TypeScript · Python · Claude API · OpenAI · PostgreSQL · Redis · AWS
